7. Project Demonstration

7.1 System Login

Project demonstration is the stage where the developed system is presented and explained to users, instructors, or stakeholders. In this phase, the working of the system is shown step by step to demonstrate its features and functions. For the project “Streamlining Ticket Assignment for Efficient Support Operations,” the demonstration shows how support tickets are created, assigned, tracked, and resolved within the system. The user first logs into the system and creates a support ticket by providing issue details. The system then automatically assigns the ticket to the most suitable support agent based on predefined rules. Support agents can view the assigned tickets, update the status, and resolve customer issues. The system also allows administrators to monitor ticket activity and generate reports. The demonstration helps prove that the system works correctly and meets the project objectives. It also helps users understand how the system improves support operations.

7.2 Ticket Creation

In this step, the user creates a support ticket by entering the issue details, category, and priority level. The ticket is then stored in the system database.

7.3 Automatic Ticket Assignment

The system automatically assigns the ticket to the appropriate support agent based on factors such as skill level, availability, and workload.

7.4 Ticket Tracking

Support agents and users can track the progress of the ticket. The system shows the ticket status such as open, in progress, or resolved.

7.5 Ticket Resolution

After solving the issue, the support agent updates the ticket status as resolved. The user is notified about the completion of the request.
